Project Demonstration

Automating Employee Data

1. Introduction

Many organizations store employee information in different systems such as spreadsheets or HR software. Managing this data manually can cause errors and delays. This project automates the process of importing employee data into the system to improve accuracy and efficiency.

---

2. Objective

- Automate employee data import
- Store employee details in the system
- Display department manager information automatically

3. System Requirements

Hardware:

- Computer or Laptop
- Internet connection

Software:

- ServiceNow platform
- Web browser
- Excel or CSV file

4. Working of the System

1. Prepare an Excel/CSV file containing employee details.
2. Upload the file using Import Sets.
3. Map the fields using Transform Maps.
4. Employee records are automatically stored in the system.
5. When an incident is assigned to an employee, the manager's email appears automatically.
6. The system assigns incident priority using predefined rules.

---

5. Advantages

- Saves time
- Reduces data entry errors
- Improves incident management

6. Conclusion

The **Automating Employee Data** project improves data management by importing employee information automatically. It reduces manual work and helps organizations handle incidents more efficiently.
