Project Design Phase

Automating Employee Data

1. System Architecture

The system architecture describes how different components of the project interact with each other.

In this project, employee data is imported from an external file such as Excel or CSV into the system. The system processes the data using Import Sets and Transform Maps. The data is then stored in the employee table. When incidents are assigned to employees, related manager information is retrieved automatically.

Main Components

- External Data Source (Excel/CSV File)
- Import Set Table
- Transform Map
- Employee Table
- Incident Table

---

2. Data Flow Design

The data flow in the system follows these steps:

1. Employee data is prepared in an Excel or CSV file.
2. The file is uploaded into the system using Import Sets.
3. Transform Maps convert the imported data into system fields.

3. Database Design

The database stores employee and incident information.

Employee Table Fields

- Employee ID
- Employee Name
- Email
- Department
- Manager Name
- Manager Email

Incident Table Fields

- Incident Number
- Assigned To
- Priority
- Description

4. User Interface Design

The user interface allows administrators or users to interact with the system easily.

Main interfaces include:

- **Employee Data Import Page** – used to upload Excel or CSV files.
- **Employee Record Form** – used to view and manage employee details.
- **Incident Form** – used to create and assign incidents to employees.

The interface is designed to be simple so users can easily manage employee and incident information.

5. Process Design

The system processes employee data automatically.

Steps in the process:

1. Upload employee data file.
2. Import data into the system.
3. Map fields using Transform Maps.
4. Store employee records in the database.
5. Assign incidents to employees.
6. Automatically display manager email and set incident priority.

6. Expected Design Outcome

The design ensures that employee data is imported and managed automatically. The system links employee information with incident management, allowing quick access to manager details and automatic priority assignment. This improves efficiency and reduces manual effort.
