Project Documentation

Automating Employee Data

1. Introduction

In many organizations, employee data is maintained in different systems such as spreadsheets, HR software, or databases. Managing and updating this information manually can lead to errors and delays.

The **Automating Employee Data** project is designed to automatically import employee information into the system. This helps maintain accurate records and improves the efficiency of incident management.

---

2. Objective of the Project

The main objectives of this project are:

- To automate the employee data import process
- To store employee information accurately
- To automatically display manager details in incident records
- To assign incident priority automatically
- To reduce manual work and improve efficiency

---

3. System Requirements

Hardware Requirements

- Computer or Laptop
- Internet connection

Software Requirements

- ServiceNow platform
- Web browser (Chrome or Edge)
- Excel or CSV file

---

4. Project Modules

Employee Data Import Module

This module imports employee data from Excel or CSV files into the system.

5. System Design

The system uses **Import Sets and Transform Maps** to import employee data into the database. The employee table stores all employee information. The incident table references the employee table to display manager details when incidents are assigned.

---

6. Development

During development, employee data files are uploaded into the system. Transform maps are created to map the imported fields with system fields. The system is configured to display manager details and automatically assign incident priority.

7. Testing

The system is tested to ensure that:

- Employee data is imported correctly
- Records are stored properly
- Manager information appears in incidents
- Incident priority is assigned automatically

---

8. Advantages

- Reduces manual data entry
- Improves data accuracy
- Saves time
- Improves incident management
- Provides quick access to manager information
