Requirement Analysis Phase

Automating Employee Data

1. Introduction

Requirement analysis is the process of identifying and understanding the needs of the system before development. In this phase, the system requirements are analyzed to ensure that the project can automate employee data management effectively.

2. Functional Requirements

Functional requirements describe what the system should do.

The system should be able to:

- Import employee data from Excel or CSV files
- Store employee details in the database
- Manage employee records such as name, email, and department
- Display manager information automatically in incident records
- Assign incident priority automatically
- Allow users to view and manage employee information

3. Non-Functional Requirements

Non-functional requirements describe how the system should perform.

Performance:
The system should import employee data quickly and efficiently.

Security:
Only authorized users should be able to access and modify employee information.

Reliability:
The system should store employee data accurately without loss of information.

Usability:
The user interface should be simple and easy to use.

4. Hardware Requirements

- Computer or Laptop
- Minimum 4 GB RAM
- Internet connection

---

5. Software Requirements

- ServiceNow Platform
- Web Browser (Chrome / Edge)
- Excel or CSV file for employee data

---

6. Data Requirements

The system requires employee data with the following fields:

- Employee ID
- Employee Name

After analyzing the requirements, the system will be able to automate employee data import and manage employee information efficiently. The system will also improve incident management by automatically displaying manager details and assigning priority levels.
